

Modern Rug, Grid Design

Description

Synthetic fiber rugs :

Synthetic rugs are also excellent decorative complements. If they do not take advantage of the nobility of naturalness and craftsmanship, today's technologies nevertheless allow a disturbing resemblance. For example, viscose is similar to silk, as for acrylic, it is an excellent artificial copy of wool. Even better, these replicas are cheaper than their natural counterparts. Other synthetic carpets take the opposite view of the natural and display fanciful colors and patterns, which only synthetic fibers allow. Indeed, the latter can be tinted and worked with the only limit being the imagination. The models offered are therefore more varied and the colors more dazzling : rugs of choice for an exalted decoration.

10A rue de Sarraltroff Reding 57445 Acrylic and polypropylene are chemically mined materials that are widely used in making rugs of all shapes and sizes. In terms of cost, products made of artificial polypropylene and acrylic fibers are cheaper than carpets woven from wool, bamboo or viscose.

Rugs made from natural materials are warmer, but less durable than those made from synthetic components.

Compared to polypropylene rugs, acrylics are warmer and more pleasant to the touch. Their fibers have characteristics similar to those of natural wool yarns. Acrylic fiber surpasses polypropylene filament in

its technical characteristics.

Despite the price difference, acrylic rugs are still more in demand than polypropylene rugs.

Advantages of acrylic flooring :

*High sound insulation when walking

- *Heat retention
- *Hypoallergenic
- *Color retention
- *Resistance to pollution
- *Acrylic carpets are not static
- *Acceptable price
- *Resistance to wetting and mold formation.

Acrylic combines the advantages: wrinkle-resistant, infelt-proof, light and particularly soft, this material meets all requirements. A rug with grid patterns for a cutting-edge
