Septaria Nodule On Base

1 375 EUR

Period : Before 16th century

Condition : Bon état

Material : Precious stone

Width : 49

Height : 50

Depth : 14

Description

Magnificent cross-section of a septate nodule on a metal base. Septarian nodules are fossilized mud bubbles dating from around 50 to 70 million years ago. Belgium is a major discovery site for these objects.Scientists disagree on how the internal shape was formed. One hypothesis is the expansion/contraction of bubbles due to gas trapped inside that cannot escape.This specimen is very large.Dimensions: 50H x 49W x 13.5P44W x 44H
