Biography : The French Company of crystal Daum was a glassworks factory founded by the Daum brothers in 1878 in Nancy, in Lorraine region. The workshops of the Daum brothers, Auguste (1853-1909) and Antonin (1864-1930), trained some of the great names of Art Nouveau like Jacques Gruber, Henri

Bergé, or Almaric Walter Schneider brothers. Following the 1870 war, Jean Daum (1825-1885), notary in Bitch, sold his notary office and opted for France. He moved to Nancy in 1876 and lent money several times to Avril and Bertrand, owner of the Nancy St. Catherine glassware factory, that produced bottles and ordinary glassware. The company didn't find its financial equilibrium and Daum was then forced to buy it in 1878 and became head of a company of 150 workers in an area that he knows nothing about. In 1878, Jean Auguste associated his son, but he didn't know the first success of the company. At his death, in 1885, Auguste took only the direction of the glass company before being joined in 1887 by his brother Antonin, just graduated from the Central School of Arts and Manufactures of Paris. Given the poor financial health of the company, Auguste, who followed legal training, was forced to take the leadership. Antonin began to beautify common wares. Familiar with the techniques of glass by training, he directed production to artistic creation. The brothers prepared, between 1889 and 1891, the establishment of an art department that was entrusted to Antonin. Auguste gave him all the means to work to follow as previously did Emile Gallé in the Art Nouveau glassware. Antonin Daum began with some simple models to continue rapidly with acid etching, then made models using wheel etching techniques, glasses made with two or three layers. From 1890 to 1914, he created about three thousand references. Jacques Gruber was the first artist of the glassware company. Recruited in 1893, he was entrusted with creating works to appear at the Chicago World Fair of 1893. It was the first major success that propelled Daum in the closed circle of the art industries. Daum's brother earned participation in the Nancy exhibition in 1894. Then there was the exhibition of Lyon (1894), Bordeaux (1895) and Brussels (1895 and 1897), during which they received awards. An art school was created in 1897 within the company as well as its own designers and

engravers. Henri Bergé was decorator in chief and was the second artist of the company. He was joined by Emile Writz from 1898. The consecration of the adventure happened when the first grand prize for the art glass of the 1900 World Exposition was awarded to Daum and Gallé. Daum presented pieces carefully prepared: vases with an insert decor (patent 1899) and lightings that became a specialty. In 1904, Almaric Walter developed glass paste ware (named "pâtes de verre"), he remained with Daum until 1915. In 1901, the Statutes of the School of Nancy were officially deposited. Emile Gallé was the man behind this group and became president. Antonin was vice-president. Antonin was also one of the personalities of the Chamber of Commerce of Nancy. It played an important role in 1909 at the International Exhibition of Eastern France, which marked the end of the School of Nancy. Auguste died in 1909, Antonin was active until his death in 1930, but shared responsibilities with the sons of Auguste: Jean, Henri and Paul. Jean died in 1916, Henri's manager as his father. Paul was a graduate of the Institute of Physics and Chemistry of Nancy, he gradually took the place of Antonin. Daum ensured after 1918, adapting the business to the new conditions of production, anxious to maintain quality there, the company continued to participate in major exhibitions: Barcelona in 1923, International Exhibition of Decorative Arts in Paris in 1925, Colonial Exhibition in Paris in 1931. In the 1920s, Paul Daum directed production to Art Deco to the loss of public interest in Art Nouveau. Demand was high and successful business. He opened a second crystal factory, "Belle Etoile", in Croismare in 1925 that Paul was the director. It provided white glass and balls. Pierre Davesne created models from 1928. Because of the economic crisis of 1930, Belle Etoile was closed in 1934. Some large orders allowed the company to continue production: in 1935, the Transatlantic Company ordered 90,000 glass and crystal pieces for the liner Normandy. After World War II, the crystal

manufactory took a prominent place under the direction of Henri and Michel Daum. The eldest grandchildren Antonin Antoine Froissart (1920-1971), an engineer from the Ecole Centrale of Paris, was developing the production of a particularly transparent and bright crystal. This new crystal favored the creation of parts with thick and soft shapes, and bright appearance. Jacques, grand-son of Auguste, brought new life in 1965 by appealing to contemporary designers.
