

Personalized Septarian Nodule On Foot

1 600 EUR

Period : 16th century

Condition : Bon état

Material : Stone

Length : 45

Height : 52

Depth : 11

Description

Magnificent cross-section of a septate nodule on a metal base. Septarian nodules are fossilized mud bubbles dating from around 50 to 70 million years ago. Belgium is a major discovery site for these objects. Scientists disagree on the origin of the internal shape. One hypothesis is the expansion/contraction of bubbles due to gas trapped inside that cannot escape. This specimen is large in size. The color palette is fantastic, with grayish, earthy and sandy areas creating a soothing atmosphere. Dimensions: 52H x 45W x 11P Without base: 46H x 37W x 5P
