

Septaria Nodule On Base

1 245 EUR

Period : Before 16th century

Condition : Bon état

Material : Stone

Length : 32

Height : 41

Depth : 11

Description

Magnificent cross-section of a septate nodule on a metal base. Septarian nodules are fossilized mud bubbles dating from around 50 to 70 million years ago. Belgium is a major site for these objects. Scientists disagree on the origin of the internal shape. One hypothesis is the expansion/contraction of bubbles due to gas trapped inside that cannot escape. This specimen is relatively small in size. Dimensions: 41H x 32W x 11P Object itself: 35H
