

Fossilized Ammonite On Custom Stand

2 750 EUR

Period : Before 16th century

Condition : Bon état

Material : Other

Length : 45

Height : 46

Depth : 23

Description

Large fossilised ammonite. On a bespoke metal stand. An ammonite is the fossil of an extinct marine animal that was related to modern squid, octopuses and nautilus. It was therefore not a snail, even though its spiral-shaped shell resembles one. Ammonites lived in the oceans around 400 to 66 million years ago. They were particularly successful during the Mesozoic Era, the age of the dinosaurs, and became extinct during the same mass extinction event at the end of the Cretaceous Period, some 66 million years ago. Dimensions: 46H x 45W x 23D Ammonite itself: 42L x 39H
