honorable mention for vases, basins, bas-reliefs, torches and religious objects. At the Universal Exhibition of 1867 in Paris, the jury awarded him a gold medal. The ironmaster was elevated to the rank of Knight of the Legion of Honor the same year. The 19th century was the century of iron, cast iron designates both a material (cast iron), a technique (foundry), a product adorned in series (mainly statuary) and urban equipment (monumental fountains, Wallace fountains, benches, candelabra, Guimard metro station entrances). Cast iron, born at the beginning of the 19th century, reached its peak at the end of the 19th century. It responded to a demand for decorative art (private and public) in a double progress: that of iron metallurgy and that of the city (urbanism of the Haussmann type). The realization of statues (in the broad sense: real characters or decorations of monuments or fountains) passed by bronze: metal easy to melt, giving a fine model appreciated by sculptors. Bronze is expensive, but is perfectly suited to an aristocratic art, which makes it valuable to the "powerful" as well as artists. At the beginning of the 19th century, a double evolution was noted: for cost reasons, the quality of the bronzes deteriorated. And the lost wax technique, which is also difficult and expensive for large pieces, has been challenged by sand casting.
